

Control room design is ErgoS' main activity and covers projects in process industry, power plants, traffic control centres, call centres, ship bridges, dealing rooms and dispatching centres.

## Key to success

Twenty-five years of control room design experience, show that user participation is the key to success in control room design projects. 3D-modelling techniques are fast, convenient and good looking. Even better results can be achieved by a full-size mock-up evaluation. A mock-up evaluation often reveals important details that did not

show up at the task analysis. Both mock-up and 3D-models are perfect visualisation aids, giving the end user 'hands-on' experience in the design process. This is essential for management approval and user acceptance of the end result, and it helps to quickly find practical solutions to many detailed design questions.
